*All accuracies indicated in this document were stated in laboratory conditions and can be guaranteed for measurements carried out in the same conditions, or carried out will required compensation. As yes in A 10-110 and the Charter 2000/2001 HYGROMETERS, GAL (Guaranteed Accuracy Limit) which has been calculated with a coverage factor value of 2 is ±2.88%RH between 18 and 28°C on the measuring range from 5 to 95%RH. Sensor drift is less than 1%RH/year.

Working principle

Capacitive sensing element for relative humidity measurement

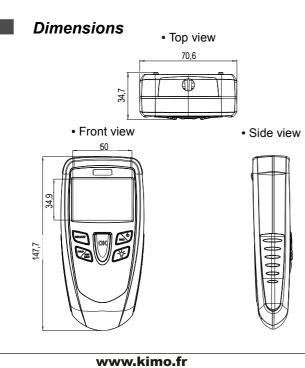

Inside the probes, a capacitive polymer layer reacts with the humidity present between two metal layers which cover a glass substract. Water absorption is a function of relative humidity of the surrounding environment, and modifies the dielectric constant. The measured signal is directly proportionnal to the relative humidity and is dependent on the atmospheric pressure.

C (RH) =
$$\frac{\varepsilon_{RH} * \varepsilon_{O} * A}{1}$$

Semiconductor temperature sensor

The direct tension of a silicon diode is : $V_{BE} = V_{G0}(1-T/T_0) + V_{BE0}(T/T_0) + (nKT/q)ln(T_0/T) + (KT/q)ln(IC/IC_0)$
